

Models that are finalised and verified:

- Words RT ✓
- Nonwords RT ✓
- Words N250 (base frequency $\times$ OS) ✓
- Words N250 (family size $\times$ OS) ✓
- Words N400 (base frequency $\times$ LP) ✓
- Words N400 (family size $\times$ LP) ✓
- Nonwords N250 ✓
- Nonwords N400 symmetric ✓

Results paragraphs that need updating:

- Nonwords N250 — needs LP contrasts updated from ± 2 to observed limits (-2.5 to $+3$)
- Nonwords N400 — needs complete rewrite based on symmetric model rather than LP-only model

Results paragraphs that are complete and verified:

- Words RT ✓
- Nonwords RT ✓
- Words N250 (both versions) ✓
- Words N400 (both versions) ✓

Discussion sections:

- Opening paragraph ✓
- N250 word subsection ✓
- N250 nonword subsection — needs minor updating to reflect that the OS reversal is now confirmed rather than marginal
- N400 section — drafted but needs revising to reflect symmetric model and reinstatement of word data

- Behavioral/ERP dissociation section — not yet drafted
- Theoretical implications and limitations — not yet drafted

The most logical next step is to get the updated nonword N250 LP contrasts, rewrite the nonwords N400 results paragraph based on the symmetric model, and then return to completing the Discussion.
